SYSTEMS FOR IMPACT

MAIN ARTICLE

"THE AGRISCANAI LAUNCH & FIELD DEPLOYMENT"

KAKAMEGA COUNTY

The launch and deployment of AgriScanAI in Kakamega County was not just a product milestone. It was a field validation of how AI-driven systems can reshape agricultural decision-making.

Re-Engineering Development Systems

Our Tech for Development Shift for Impact

Across Africa, a critical shift is underway. Development is no longer defined by isolated interventions or standalone tools. It is increasingly about how systems are designed, integrated, and scaled to deliver sustained impact.

At Good Partners, this quarter marks a clear evolution in our work. We are deepening our commitment to **a Tech for Development (T4D)** approach; one that prioritizes **digital infrastructure, interoperability, and system-level transformation** over fragmented solutions.

Our focus is simple but ambitious:

To design and deploy the core systems that enable development work to function reliably, transparently, and at scale.

This quarter reflects that shift in action, building digital infrastructure that strengthens how critical sectors including health, agriculture, finance, environment, education and humanitarian support are managed, measured and scaled. Our work sits at the intersection of technology and real-world delivery, where impact is not defined by innovation alone, but by how effectively systems serve people, improve decisions and enable accountability at scale.

Advancing Development Through Strategic Partnerships & Dialogue

To support this transition, we are moving beyond standalone digital products toward interconnected ecosystems. We design platforms that communicate, share data securely, and integrate into real-world workflows across sectors. By enabling interoperability and real-time data exchange, we help partners shift from reactive to proactive, evidence-based decision-making. This approach ensures solutions are scalable, adaptable, and built for long-term impact.

A Defining Moment: The AgriScanAI Launch & Field Deployment

Kilimo Training Institute of Permaculture (KTIP) Farmers Training

This quarter marked a major milestone in our journey, with the official launch and field deployment of AgriScanAI

The launch and deployment of AgriScanAI in Kakamega County was not just a product milestone. It was a field validation of how AI-driven systems can reshape agricultural decision-making. Working with the Kilimo Training Institute of Permaculture (KTIP), we onboarded over 100 smallholder farmers into a system designed to move agriculture from a reactive, fragmented and informal practice, into one that is predictive, data-driven, structured and measurable.

This is the core of Tech for Development: Transformation begins when systems change how people think and decide; not just what they use.

For many, this was their first experience with AI in agriculture. But what followed was even more important. Farmers engaged with AgriScanAI capabilities such as AI-powered crop disease detection, Farm financial tracking and record-keeping, Localized advisory MwaneduAI and tracking of carbon emission and sequestration activities. But the most important shift was not technological. It was cognitive. Farmers began to ask deeper, system-oriented questions.

- How do I optimize soil health over time?
- How do I plan financially across seasons?
- How do I improve long-term productivity?

Redefining Adoption: From Usage to System Transformation

The field deployment revealed a critical insight, adoption is not only about feature usage. It is about behavioral and decision-making shifts within a system.

We observed:

- Strong openness to AI when embedded in trusted local structures
- Immediate demand for integrated services (market linkages, soil intelligence data, financial and credit access)
- Continuous user feedback actively shaping system evolution
- Transition from tool interaction to system thinking

This reinforces a central T4D principle that scaling impact requires systems that users adapt into, not tools they adapt around.

BetterPay: Embedding Accountability into Digital Infrastructure

Across development programmes, inefficiencies continue to persist, often driven by fragmented workflows, manual processes, limited financial visibility, and weak audit trails. These gaps not only slow down implementation but also undermine transparency and trust across stakeholders.

BetterPay addresses these challenges not as a standalone tool, but as core programme infrastructure. It integrates digital registration and attendance verification, automated rule-based payments, real-time budget tracking, and audit-ready reporting into a single, coordinated system that strengthens how programmes are executed and monitored.

The shift this enables is fundamental. Accountability is no longer treated as an external requirement to be enforced; it becomes a built-in property of the system itself. This reflects a core principle of Tech for Development, designing systems where integrity is embedded by default, rather than dependent on oversight.

Our Core Solutions

Across our work, one principle remains constant: we do not build standalone tools, we build **connected systems that strengthen how institutions, communities and industries function.**

Each of our flagship platforms is designed to address structural gaps in service delivery, while enabling efficiency, transparency and data-driven decision-making at scale.

AgriScanAI - Agriculture Intelligence Platform

AgriScanAI is our flagship agricultural intelligence platform designed to transform how farmers make decisions in an increasingly unpredictable climate and market environment. It enables a shift from reactive farming to predictive, data-driven agriculture. Powered by computer vision, machine learning and localized agricultural intelligence, AgriScanAI delivers context-specific insights based on real farm conditions rather than generic recommendations.

Its core capabilities range from real-time crop disease detection, weather and climate analytics for planning and risk mitigation, crop yield prediction models for production planning and personalized and localized farming recommendations. AgriScanAI is built for accessibility in low-connectivity environments, ensuring farmers in remote regions can still access actionable intelligence.

BetterPay - Programme Operations & Payment Infrastructure

BetterPay is a Technology for Development (Tech4D) platform that delivers end-to-end digital infrastructure for the management, verification, and disbursement of funds across development and humanitarian programmes.

It is designed to address systemic inefficiencies in programme execution by integrating core operational layers into a single, coordinated system. These include participant identification and registration, verification and attendance tracking, a disbursement engine for bulk payments, automated financing and approval workflows, and real-time data and reporting.

By structuring these components within one platform, BetterPay enables transparent, efficient, and accountable programme delivery, embedding financial integrity and operational visibility directly into how programmes are implemented.

BetterPay is built in alignment with Kenya's Data Protection Act and modern security standards, thus ensuring responsible handling of sensitive programme data.

Vala AI - Knowledge Intelligence System

Vala AI is an enterprise knowledge intelligence platform designed to help organisations access, structure and retrieve institutional knowledge instantly.

It transforms fragmented organisational data into accessible, conversational intelligence, improving decision-making and operational efficiency.

Core capabilities include:

- AI-powered knowledge search and retrieval
- Natural language querying across organisational data
- Integration with documents, systems and internal databases
- Multi-channel access (web, mobile and messaging platforms)
- Context-aware responses for teams and stakeholders

Vala AI reduces dependency on manual document searching and institutional silos, enabling **faster, more informed decision-making**.

HealthBridge - Digital Health & Continuity of Care Platform

HealthBridge is a digital health platform designed to strengthen post-discharge patient management, community-level monitoring and care coordination systems.

It addresses a critical gap in healthcare systems; the transition from facility-based treatment to continuous home-based care.

HealthBridge enables predictive, data-informed healthcare coordination.

Core capabilities include:

- Cross-platform mobile and web access for patients and providers
- Secure clinical data, vitals and adherence tracking systems
- Role-based dashboards for patients, caregivers and healthcare providers
- AI-driven reminders, risk scoring and workflow prioritization
- Alert systems for abnormal vitals and missed care activities
- Analytics-ready infrastructure for health system planning and reporting

This enables health systems to move from reactive care delivery to **continuous, preventive, and coordinated patient management**.

Pivot - Event Management & Programme Coordination Platform

Pivot is a structured event and programme management platform designed for organizations managing large-scale engagements, training and stakeholder activities.

It simplifies how programmes are executed end-to-end from registration to reporting.

Core capabilities include:

- Digital registration and participant onboarding
- Attendance tracking using QR-based systems
- Payment and reimbursement workflows
- Event scheduling and coordination tools
- Expense tracking and budget monitoring
- Post-event analytics and reporting

Pivot ensures that large-scale engagements are not well-managed but also **measurable, traceable and financially accountable**.

One Ecosystem with Shared Impact

Together, these systems form a unified ecosystem designed for one purpose:

To strengthen how development programmes, public systems and industry operations function through integrated, intelligent infrastructure.

Rather than isolated tools, our platforms are designed to interoperate across sectors, enabling:

- Shared data systems
- Improved accountability
- Cross-sector intelligence
- Scalable digital transformation

This is the foundation of our Tech4Development approach; building systems that reflect how real-world institutions actually operate.

Looking Ahead

As we move into the next quarter, our priorities include:

- Scaling AgriScanAI beyond pilot communities into wider regional adoption
- Deepening BetterPay integration with NGO and donor ecosystems
- Expanding AI-driven analytics and decision-support tools
- Strengthening research and funding partnerships
- Enhancing interoperability across all platforms

Our focus remains consistent to build systems that improve how development actually works, not just how it is reported.

Leadership Reflection: From Data to Impact

Across Africa, we are witnessing a quiet but powerful transformation. Not driven by hype, but by necessity; by farmers, health workers and programme teams who are rebuilding systems that were never designed to fully serve them.

At Good Partners, we do not build technology for innovation's sake. We build it for clarity, accountability and human impact.

The launch of AgriScanAI this quarter marked more than a product milestone. It marked a shift from concept to lived experience in the hands of farmers.

In Kakamega, farmers began asking deeper questions about soil health, financial tracking and productivity. That shift from usage to understanding is where transformation begins.

Similarly, BetterPay continues to show that when systems are structured correctly, accountability becomes automatic and not enforced.

But one truth continues to guide our work; technology alone is not transformation, systems alignment is.

True transformation happens when data, institutions and people operate from a shared foundation of trust, transparency and accessibility.

Africa does not need more disconnected tools. It needs integrated systems that reflect how people actually live and work.

To our partners, donors and collaborators, thank you for continuing to believe that technology can be both intelligent and humane.

We are just getting started.

Elizabeth Mwashuma
Founder & CEO, Good Partners

KTIP's Partnership with Good Partners

Kilimo Training Institute of Permaculture (KTIP) is honored to partner with Good Partners in piloting the AgriScanAI platform among 117 onboarded smallholder farmers from Kakamega County.

Through this collaboration, Good Partners has played a key role in introducing innovative digital agriculture solutions that are helping farmers "Scan, Detect, Protect, and Grow" their crops.

The launch of AgriScanAI this quarter marked more than a product milestone. It marked a shift from concept to lived experience in the hands of farmers.

Farmers are now benefiting from disease scanning, AI-powered recommendations, the MwaneduAI Assistant, financial tracking and carbon tracking tools that support smarter and more sustainable farming decisions.

KTIP mobilized and organized the farmers, while Good Partners provided technical training and support, ensuring farmers could effectively use the platform in real farming environments.

This partnership is demonstrating how technology, when combined with practical farmer engagement, can strengthen climate resilience, improve productivity and create more sustainable livelihoods for rural farming communities.

We appreciate Good Partners for their commitment to innovation and for supporting smallholder farmers through accessible and impactful digital solutions in western Kenya.

Responsible AI

AI basic concepts and productivity tools

WHY AI MATTERS IN INKOMOKO

- Operational Benefits**
 - Faster delivery
 - Improved decision-making accuracy
 - Reduced manual workload
- Strategic Benefits**
 - Scalable SME support
 - Data-driven insights
 - Improved reporting quality
- Organizational Impact**
 - Reach more clients using same resources
 - Improve consistency across teams
 - Enhance program effectiveness

Equipping teams with practical AI skills for productivity, creativity, and impact.

Good Partners X InkoMoko AI Training

Work With Us

The future of development will not be built in isolation. It will be built through partnerships that combine technology, field expertise and shared intent. At Good Partners, we work with organisations that are ready to move beyond fragmented approaches and invest in systems that scale impact.

For Development Partners & NGOs

If you are implementing programmes across agriculture, health or social protection:

- Digitise and streamline field operations using BetterPay
- Strengthen transparency, reporting & donor accountability
- Improve programme efficiency from registration to payment

For Government & Institutions

If you are designing or scaling national and county-level programmes:

- Build interoperable digital systems that connect data, people and services
- Strengthen service delivery and real-time decision-making
- Deploy infrastructure aligned with long-term system goals

For Agribusinesses & Farmer Organizations

If you work directly with farmers and agricultural value chains:

- Deploy AgriScanAI to support farmer productivity and resilience
- Improve data visibility across your supply chain
- Enable farmers with tools for better decision-making and financial tracking

For Donors & Investors

If you are funding development programmes or digital transformation:

- Support scalable, systems-driven infrastructure
- Invest in solutions that deliver measurable, traceable impact
- Partner in expanding Tech4Development systems across Africa
